Date :

Abstract

The ONLINE OASIS Android application is an Grocery Shopping application which has a number of features fused in one app. The app can be used by anyone without even having a prior knowledge about android applications. The application is totally userfriendly. It is a multi-vendor grocery app which offers several brands of products from multiple vendors, shops, big or small, showcased together on the same application. There are a no of applications solely conecentrating on food, furnitures, clothes, home essentials, etc and all these are are programmed in a way that they can do only 2-3 tasks for a user. This application tries to cover all those features all in it. It will have a number of features such as simple payment arrangements including both cash on delivery and online UPI transactions, Mail Marketing tools, social media platforms integrations, excellent interface, live location Tracking, Online cart, Delievry boy, Customer Reviews,Ratings &feedbacks etc. Our aim would be to provide the maximum amount of features that the customers require to make it a successful marketplace platform.

DECLARATION

We hereby declare that the project entitled, “**The Online Oasis Android Application**” done at **SIES COLLEGE OF ARTS, SCIENCE & COMMERCE(AUTONOMOUS)-SION(W)**, has not been in any case duplicated to submit to any other university for the reward of any degree. To the best of our knowledge other than us, no one has submitted to any other university.

The project is done in partial fulfillment of the requirements for the reward of degree of **BACHELOR OF SCIENCE (COMPUTER SCIENCE)** to be submitted as 5th semester project project as part of our curriculum.

Chapter 1: Introduction

- The Online Oasis android application is an application which will have a number of features fused in a single app. The app can be used by anyone without even having a prior knowledge about android applications. The application will be totally user-friendly.
- The application is a e-commerce marketplace or u can say a multi-vendor grocery app which offers several brands of products from multiple vendors, shops, big or small, showcased together on the same application. There are a no of applications solely concecentrating on food, furnitures, clothes, home essentials, etc and all these are are programmed in a way that they can do only 2-3 tasks for a user. Our aim would be to find a way to incorporate all of these tasks in a single application & make it easier for the user to access them as it would save both time and memory for navigating from one app to another.
- The Online Oasis will be designed in such a way that it showcases products by a multiple of vendors. So, it removes the stress for customers searching for products all over the internet Instead of wasting time, browse one marketplace to find all they need within a choosen product category. It helps buying the products in the shop anywhere through internet by using an android device.
- It will have a number of features such as simple payment arrangements including both cash on delivery and online UPI transactions, Mail Marketing tools, social media platforms integrations, excellent interface, live location Tracking, Online cart, Delievry boy, Customer Reviews,Ratings &feedbacks etc. Our aim would be to provide the maximum amount of features that the customers require to make it a successful

Advantages of Online Shopping:

- Save Time
- Save Fuel
- Save Energy
- Comparison of Prices
- 24/7 Availability
- Hate Waiting in Lines
- Too Ashamed to Buy
- Easy to Search Merchandise You Want to Buy

Say goodbye to the days when you stood in the line waiting, and waiting, and waiting some more for a store clerk to finally check out your items. Online shopping transactions occur instantly saving you time to get your other errands done! Additionally, unlike a store, Online shopping has friendly customer service representatives available 24 hours a day, 7 days a week to assist you with locating, purchasing and shipping your merchandise.

OBJECTIVES

- As this is an android application it can be used by anyone anywhere at anytime, the main objective are:
 - Process the details provided by the user and provide the proper results without any hindrance.
 - To provide a wide range of of collections of products to choose from.
 - The application allows only authorized users to access the application and its services.

- The central concept of the application is to allow the customer to shop virtually using the Internet and allow customers to buy the items and articles of their desire from the store.
- The system recommends a facility to accept the orders 24*7 and a home delivery system which can make a customer happy.

PURPOSE

- This project will determine how it is easier for the users to get benefited by different services provided by a single Android Applications.
- All the services provided by the application will be easily understandable and of great use for the user.
- The user will not have to download and install multiple number of applications and create lots of accounts with different usernames and passwords, as all of these will be confined in a single application which requires only a single username and password for login.
- After Logging in the authorized the users can make use of all the services provided by the application.

Scope

- The application has multiple uses in day to day life. Its easier for the user to find products of their needs and order it in the online way which reduces the need to find a specific time to go to different shops to find your needs. This application will have all kinds of products altogether in a single applications so u will not to go to different shops all over to find products.
- Since the application does most of the tasks which are rather done individually by different applications which in turn takes up most of the memory space, having most of these tasks in on single application makes it easier for the user to navigate through without any complication or wasting a lot of memory space.
- Having the application run on Android which is user-friendly and an open source software makes it much easier for the user to understand and get used with. It would be very useful Application in day to day life.

Chapter 2: Survey of Technologies

Comparitive Study:

Mobile Applications run on many operating systems namely Android OS, Blackberry OS, iOS(Apple OS), MeeGo OS, Palm OS, Bada(Nokia), Symbian OS, Windows phone, webOS. Out of all this the Android OS, iOS and Blackberry OS are the most popular operating systems used in handheld devices. These operating systems have been there on the global market for a long time and thus come up with new added features and benefits every year with the rapid development in the field of Computer Science. Although many operating systems are available for smartphones these days, not all are reliable and user-friendly or freely available and platform independent. And due to these reasons Android OS has been the most popular and widely used operating system in the world.

Android OS is a mobile operating system developed by Google and also happens to be open sourced. It was specifically designed for touchscreen mobile phones such as smartphones and tablets. Android also supports a suite of proprietary software developed by Google including the Gmail and Google Search as well as the application store Google Play and the associated development platform. Major Android versions are released periodically with updated features.

iOS is a mobile operating system created and developed by Apple Inc. exclusively for their hardware only. It is the most popular mobile operating system globally second to only Android. iOS user interface mainly based upon direct manipulation using multi-touch gestures. The iOS has accessibility function making it easier and accessible for users with vision and hearing disabilities.

The main difference between the Android OS and iOS is the former is an open source OS, whereas the latter is a uniform platform. This discrepancy makes the Android OS as the most sought out and reliable operating system in mobile application development by smartphones and tablet developers. Since, Android is Linux based and more PC-like than iOS, its interface and basic features are generally more customizable and user-friendly.

Android applications can be developed using many applications development software available today. Visual studio was one of first and most used IDE for mobile development. But the IDE worked on only windows 8, so the previous version of windows couldn't operate Visual Studio. Eventually Visual studio was replaced by new platform independent Ides and it lost all its shine.

Android Studio happens to be the official IDE for Google's Android operating system specially designed for Android mobile application development. It is a platform independent IDE which can run on Windows, Mac OS and Linux based operating systems. Using Android Studio building of android apps with more accurate and beautiful designs are easier. Since Android Studio is a freeware no license fee is needed. Developing Android applications through Android Studio is the best way for an independent mobile application developer as that is the easier and budget friendly way.

Xamarin studio is a cross platform IDE for the development of mobile application. Xamarin integrates C# and .NET as its base language through which developers can develop write code for Android OS, iOS and share it across multiple platforms such as Windows and MacOS. Since it is across platform IDE learning and development time can be saved.

The Main difference between Android Studio and Xamarin Studio is that the former is a freeware and not licensed making it affordable for individual developers. Whereas the latter is a licensed product which can be used only when there is large organizations or business involved. Also. Since Android Studio happens to be the official IDE for android mobile applications development its specifically works for them and are faster in execution. Android Studio is the clever way for developing android applications.

Database:

Mobile operating system are growing bigger and larger and its hardware as powerful as normal computing devices. Databases are the best way of storing and managing data for an android mobile application. Data stored inside a database can be easily modified and retrieved.

Databases used for android mobile applications need to be low memory and power consuming.

There happens to be a number of databases available for storing data for a mobile application. SQLite, RealmDB, FirebaseDB, ORMLite, Room and MySql are few of the databases used in mobile application today.

Mysql is an open source relational database management(RDBMS). It is mostly written in C and C++. It works on many platforms. Android applications use MySQL for storing data. It comes with updateable queries.

For all those developers who have been searching for a robust platform for building mobile and web application, you can bank upon Firebase. The Firebase is a Backend-as-a-Service (BaaS) that offers the developers a wide spectrum of tools and services to develop high-quality apps at a much faster pace. In fact, it allows the developers to develop feature for apps on different platforms like Remote Configs, Notifications and Real-time Databases. In addition, it also helps you to develop storage for the app including authentication functionality. Moreover, Firebase can also be used effectively for app marketing, enhancing the user experience and user engagement.

There are enough differences between Firebase and MySQL. For one there is no server connection required for running Firebase unlike MySQL. Also, no server-side scripts are needed in Firebase. Database partitioning doesn't happen in Firebase. All this makes Firebase a sensible choice for android mobile applications.

Why Choose a Particular Technology

ONLINE OASIS Android application is specifically designed for android applications only. Since its an android application anyone can use it and it will run on most of the smartphones OS except for the iOS. That's the main advantage of the application, it can be accessed anytime the user want's it and also it won't take much memory space in a mobile device. Even though Android applications use an IDE and database and other software to develop it, the end product is a single application which the users can install on their mobile devices.

Since the application is developed using Android Studio which is officially the IDE used for Android applications development its is easier for the developer to get adapted to thye IDE. Android Studio uses a drag and drop layout, the designing of the application is much more easier and time saving. The look and appeal of the app can be improved by using Android Studio.

Firebase as a database helps storing the user information and accessing it without any hindrance. The database will help showing duffernet catagories of products and different features to both admin as well as thew customer and fire up the queries faster. Using Firebase, the execution of data stcan be faster.

Chapter 3: System Study:

In day to day life, we will need to buy lots of goods or products from a shop. It may be food items, electronics, household items, clothing, etc etc. Now a days, it is really hard to get some time to go and get them by ourselves due to busy life style or lots of works. In order to solve this, our Online Oasis app has been created. Using this, we can buy goods or products online just by visiting the application and ordering the item of our wish by making online payments.

Existing System:

Many customers go for offline purchasing so as to examine the products and hold the possession of the product just after the payment for the product. In this contemporary world customer's loyalty depends upon the consistent ability to deliver quality, value and satisfaction. Offline shopping has a sense of immediacy. You got to possess the item you've purchased the very moment.

If we can search and make a list of what we would like to try while shopping, before actually going out, this way we can more confident in our purchase and not missing out something... This can also help us to decide what areas to visit. And plan such an event with friends.

Limitations of Existing System:

- Time consuming
- Shipping Rates
- Refunds/Returns Disputes
- Lack of Options
- Cash-Back offers not present
- Bad customer Service

Also there are expenses for travelling from house to shop. More over the shop from where we would like to buy something may not be open 24*7. In order to overcome these, we have e-commerce solution, i.e. one place where we can get all required goods/products online.

Proposed System:

To remove all the disadvantages of conventional methods, an application is proposed which is our Online Oasis.

The purpose of Online Oasis is to save time, save money. Through online shopping one can save his valuable time. One can watch and select things he/she wants to buy. Through online shopping we can save our money because prices are less than market prices and there are cashback and many more offers/coupons too. No need to go anywhere and do shopping. We can get different varieties of things online and we can choose which one we want.

Through Online Oasis, a person who wants to buy is a lifestyle e-commerce application, which retails various fashion and lifestyle products. This project allows viewing various products available enables registered users to purchase desired products instantly using online payments and also can place order using Cash on Delivery (Pay Later) option. This project provides an easy access to Admin to view orders placed using Pay Later and Instant Pay options. In order to develop an e-commerce application, a number of technologies must be studied and understood.

Need for the Proposed System:

- **Convenience:** This is one of the main reasons that online shopping has become so popular, as it allows you to switch stores and products by clicking a button rather than travelling to a new store.
- **Selection:** Of course, a large selection means that your decision making process may be a bit more difficult, but it also makes it more likely that you will find a high quality product that truly pleases you.
- **Immediacy:** When you purchase a new product, whether for yourself or for someone else, it is always nice to have that product in your possession immediately.

- **Quality:** Needless to say, the quality is also very important. And, while most online shopping offers you the ability to return faulty or imperfect products.
- **Saving Money:** Another very important aspect of any shopping experience is trying to save as much money as possible. One reason that people enjoy online shopping is that you can often find a product more cheaply online than you can in stores.
- **Discount and offers:** Yes online shopping is better than offline shopping because we can shop at any of our favourite and can get the delivery on same day itself.

Chapter 4: System Analysis

- Feasibility study:** The objective of feasibility study is to determine whether or not the proposed system is feasible. The feasibility is determined in terms of four aspects, These are:
- **Behavioural Feasibility:** The customers are using different types of peripherals devices. Our application is capable of providing user friendly interface for all devices.
 - **Economical Feasibility:** As a part of this, the costs and benefits associated with the proposed system are compared and the project is economically feasible only if tangible and intangible benefits outweigh the cost. The cost for proposed online shopping application is outweighing the cost and efforts involved in maintaining the registers, books, files and generation of various reports.
 - **Technical Feasibility:** In this, one has to test whether the system can be developed using existing technology or not, it is evident that necessary hardware and software are available for development and implementation of proposed system. We acquired the technical knowledge of working in languages, and then only we have started designing our project.

Overview of System

Main Objective: The objective of this software is to provide easy assistance to both the customer as well as the merchant with proper database and information. Online shopping is something most of us take for granted these days. We enjoy the convenience and other benefits of shopping online. You can do shopping while in the comfort of your own home, without having to step out of the door. Sell at lower rate due to less overhead. No wait to see the products if someone else is taking that.

The application provides the following facilities to the Admin:

- Admin can add product to database.
- Admin can edit/save/delete products from the database.
- Admin can add and see the delivery report to the database.

The Application provides the following facilities to the customers:

- The customers register with their details and get authentication for an authorized Login.
- Customers are provided with up to date information on the products available by categories.
- Using shopping cart, see the item selected appears in the shopping.
- Select shipping option for item purchased if the item is being delivered physically.
- Using payment options, use either online or offline modes.
- After successful payment, products are delivered to the address the customer has given.

Design: Customers are attracted to online shopping not only because of high levels of convenience, but also because of the broader selections, competitive pricing, and greater access to information. Business organizations seek to offer online shopping not only because it is of much lower cost compared to bricks and mortar stores, but also because it offers access to a worldwide market, increases customer value, and builds sustainable capabilities.

Customers: Online customers must have access to the Internet and a valid method of payment in order to complete a transaction. Generally, higher levels of education and personal income correspond to more favourable perceptions of shopping online. Increased exposure to technology also increases the probability of developing favourable attitudes towards new shopping channels.

Payment Gateway: Online shoppers commonly use a credit card or UPI account in order to make payments. However, some systems enable users to create account to pay by alternative means, such as:

- Cash on delivery (C.O.D)
- Debit Card
- Credit Card
- Gift Cards
- Online Banking

Product Delivery: Once a payment has been accepted, the goods/services can be delivered in the following ways:

- **Drop shipping:** The order is passed to the delivery agent, who then ships the item directly to the customers. By passing the retailer's physical location to save time, money, and, space.
- **In-store pick-up:** The customer selects a local store using locator and picks up the delivered product at the selected location. This is the method often used in the bricks and clicks business model.
- **Printing out:** provision of a code for, or e-mailing of such items as admission tickets and script. The tickets, codes, or coupons may be redeemed at the appropriate physical or online premises and their content reviewed to verify their eligibility.
- **Shipping:** The product is shipped to a customer-designated address. With the onset of the Internet and e-commerce sites, which allows customers to buy tickets online, popularity of this service has increased.

Chapter 6: System Modules

Key StakeHolders

- Platform Owners: (Admin)
- Grocery Store Partners: (Vendors)
- Delievery Partners: (Delivery Boy)
- Customers/Users
- Digital Marketing Service

Features:

Customers: Mobile App

Platform Owners(Admin): Mobile App

Delievery Partners: Mobile App

Restaurant Grocery Store Partners(Vendors): Mobile App

Basic Modules for Customers:

- 1) Sign Up:
- 2) Sign In:
- 3) Browse products:
- 4) Browse stores:
- 5) Product Details:
- 6) Search Option:
- 7) Location Based searches:
- 8) Make Order:
- 9) Apply Coupons:
- 10) Payment Gateway Integration:
- 11) Track Orders:
- 12) Rate and reviews:
- 13) Notification:
- 14) Re-Order:

Platform Owners(Admin):

- 1) Sign In:
- 2) Manage Menus: 3) Manage Orders:
- 4) Manage Customers:
- 5) Manage Payments/Commissions:
- 6) Manage Delivery Partners:
- 7) Manage The Delivery Zones:
- 8) Marketing Activities: 9) Ananlysis & Reports:
- 10) Push Notifications:
- 11) Payment Management:
- 12) Invoice Manager for Delivery Partners:
- 13) Point Of Sale Integration:
- 14) Customer Call & Chat Support:
- 15) Feedback, Reviews and Ratings:
- 16) Manage Vendors:

Restaurants Grocery store(Vendors):

- 1) Loyalty Points Management:
- 2) Delivery Request Notifications:
- 3) Accept/Reject Delivery Request:
- 4) Check Customer Location via Gps:
- 5) Manage Customers and Deliveries:
- 6) Delievery Confirmation:
- 7) Order Dashboard:
- 8) Store Management:
- 9) Accept/Reject Odrers:
- 10) Payment Management:
- 11)

Delivery Partners(Delivery Boy):

- 1) Search Engine Optimization(SEO)
- 2) Social Media Marketing
- 3) Manage Orders:
- 4) Weekly Earnings:
- 5) Booking History:
- 6) Accept Bookings:
- 7) Manage Earnings:
- 8) Route Optimization:
- 9) Check Customer Location via Gps:
- 10) In-app Call/Chat With Customer/Store

Digital Marketing Service:

- 1) Sesarch Engine Optimization(SEO)
- 2) Social Media Marketing
- 3) Web Design & Development
- 4) Pay-Per Click
- 5) Online Reputation Management
- 6) E-Commerce Marketing
- 7) Nextdoor Ardvertising
- 8) Content Writing

Privacy Policy

- Delivery Process-Fast:100rs extra charge—Normal Charge:50rs—
- Active riders get message for delivery if they won't response or after 10 minutes deactivate the delivery request and the request is sent to another delivery person. Once a delivery person is assigned to a task its delivery status is turned to BUSY if any delivery person has log out then its status will be shown as OFF and whom are Active but don't have any task their status will be Active.
- If any Customer has purchased any product and he/she will comment on that product then it will be shown as **Certified Buyer** it is Beneficial for our Platform . After purchasing the Product customer will be notified to review the product
- After ordering any product if customer cancels it so cancellation charges may applicable and if replacement requests comes from customer then it depends on replacement policy of the customer
- If we want to fire any employee so we will give the firing letter/message one month before firing as a final warning
- If any product is faulty/expiry we or customer catches it then it will be returned and new product will be delivered
- After 3+ complaint of Customer than we will fire that Delivery person after proper investigation
- Proper Segregation of Complaints of All department in terms of employees/product/software issues
- After any employee has leaved/fired the organization then its account will be deactivated but Note that its history and details will be saved
- If any employee is getting salary exceeding from the limit then the owner will be notified about the situation.

Mobile app registration screen. At the top, there is a camera icon and the text "Upload Image". Below this are five input fields: "Business Name", "Enter Mobile Number" (with a 0/10 character count), "Email (eg. abc@xyz.com)", "Password", and "Shop Address". A blue "SIGN UP" button is positioned below the "Shop Address" field. At the bottom, there is a link "Already a user? LOGIN". The screen is framed by a white border with a black Android-style navigation bar at the bottom.

Mobile app login screen. At the top, there is an illustration of a person wearing a headset next to a smartphone. Below this are two input fields: an email field containing "fresh_mart@gmail.com" and a password field with masked characters. A blue "LOGIN" button is positioned below the password field. Below the button is a link "Need an account? SIGN UP". The screen is framed by a white border with a black Android-style navigation bar at the bottom.

Code

The screenshot displays an IDE interface with a project named 'grocery_app' located at 'C:\Users\Admin\StudioF'. The left sidebar shows the project structure, including folders for 'assets', 'build', 'ios', 'lib', 'models', 'providers', 'screens', 'services', and 'widgets'. The 'main.dart' file is selected in the 'lib' folder. The right pane shows the code for 'main.dart', which defines the 'main' function and the 'MyApp' class. The 'MyApp' class extends 'StatelessWidget' and implements the 'build' method. It initializes Firebase and returns a 'FutureBuilder' widget. The 'FutureBuilder' widget has a 'future' of '_initialization' and a 'builder' that returns a 'MultiProvider' widget. The 'MultiProvider' widget lists several providers: 'ChangeNotifierProvider' for 'AuthProvider', 'LocationProvider', 'StoreProvider', and 'CartProvider'. The 'child' of the 'MultiProvider' is a 'MaterialApp' widget with a title of 'Flutter Demo', a theme of 'ThemeData' with 'Colors.blue' as the primary swatch, and a list of routes. The routes include 'LogoScreen', 'RegisterScreen', 'HomeScreen', 'MapScreen', 'VendorHomeScreen', 'CategoryScreen', 'BottomScreen', and 'SubCategoryScreen'.

```
26 void main() {
27   runApp(const MyApp());
28 }
29
30
31 class MyApp extends StatelessWidget {
32   const MyApp({Key? key}) : super(key: key);
33
34   // This widget is the root of your application.
35   @override
36   Widget build(BuildContext context) {
37     final Future<FirebaseApp> _initialization = Firebase.initializeApp();
38
39     return FutureBuilder(
40       future: _initialization,
41       builder: (context, appSnapshot) {
42         return MultiProvider(
43           providers: [
44             ChangeNotifierProvider(create: (_) => AuthProvider()),
45             ChangeNotifierProvider(create: (_) => LocationProvider()),
46             ChangeNotifierProvider(create: (_) => StoreProvider()),
47             ChangeNotifierProvider(create: (_) => CartProvider()),
48           ],
49           child: MaterialApp(
50             title: 'Flutter Demo',
51             theme: ThemeData(
52               primarySwatch: Colors.blue,
53               pageTransitionsTheme: const PageTransitionsTheme(builders: {
54                 TargetPlatform.android: FadeUpwardsPageTransitionsBuilder(),
55               }), // PageTransitionsTheme
56             ), // ThemeData
57             routes: {
